

Pharmacy Department Guidelines

Role of the Pharmacy Department

- The pharmacy reviews, dispenses, and monitors all medications ordered for inpatients and outpatients.
- A licensed pharmacist reviews every new medication order for appropriateness, dosing, and interactions before it is dispensed.

Dispensing Process

- Inpatient medications are dispensed through a unit-dose system, with each dose individually packaged and labeled.
- Outpatient prescriptions require a valid prescription from a registered physician and are verified against the patient's known allergies.
- Controlled substances (e.g., opioids) require additional documentation and are tracked in a separate controlled-drug register.

Medication Safety Checks

- The pharmacy system automatically flags drug-drug interactions, duplicate therapy, and allergy conflicts.
- High-alert medications require pharmacist counter-verification before release to the ward.

Patient Counseling

- Outpatients receiving new medications are offered counseling on dosage, side effects, and storage before leaving the pharmacy.
